

Revolut *Primacy*

Why Revolut users don't make it primary — and two growth-hacking ideas, sized to compound, that move the dial without paying for the salary.

Executive summary

One-page distillation. The body that follows is the working-out — read it if you want to stress-test the reasoning, the screens, or the metrics.

Thesis. Revolut’s primacy gap is not an acquisition problem — 52M global / 13M UK users and Trustpilot 4.5/5 prove the love is there. It’s a *salary-mandate* problem: average UK consumer deposit is **£575/mo at Revolut vs £811 at Monzo and £2,944 at Starling**, and the 2024 Annual Report dodges the absolute primacy number, disclosing only 59% YoY growth. The wedge: users have rationally settled into a **two-bank cohabitation** — Revolut for spending + FX + crypto, high-street for the salary. Primacy will only move when the cohabitation deal is broken.

The asymmetry in the pain space. Of the five macro pains, **two have no current vitamin counter** in the live product — P1 *perceived operational risk* (the AML-hold-on-payday fear; Reddit’s highest-engagement primacy thread is “*Can’t access my salary. I am suing.*”, 1,006 upvotes) and P5 *primacy-hostile product surface* (Home is optimized for cross-sell, salary-aware components like Pockets and Payday exist but aren’t merchandised). The other three pains are either structural (bank licence, branch, lock-in products) or partly mistargeted. **That asymmetry IS the strategic idea space.**

The two ideas — a push-pull pair, both true growth-hacks (no new financial products, no licensing dependency), neither pays for primacy:

	Idea 1 · Confidence Period	Idea 2 · Locked Insights
Type	Push — migration de-risk	Pull — only-on-primary value
Mechanic	3-salary-cycle parallel-run via Open Banking + auto-mirror % back to the old bank + Live Clearance reassurance layer (real-time “Salary cleared in N minutes” push the instant AML completes, 24h pre-payday confidence reminder, public historical AML-clearance stats card on profile)	Visible-but-locked Insights surface — real cards with blurred numbers + a one-time sample peek with example data; primary unlocks subscription audit, cashflow forecast, DD payday optimization, anomaly detection. Built on Revolut’s existing Analytics infrastructure (subscription detection, spending categorization already live) — only the locked-state UI + sample peek + Open Banking population for non-primary peek is new
Attacks pain	P1 + P4	P5 + V2 mistarget
Build	~3 months — pure UX + existing AISP + existing analytics; no licensing dependency	~2-3 months — locked-state UI + sample peek + thin salary-aware logic on existing analytics
Y1 impact	~4pp UK primacy lift (≈400k incremental primary users at 10M UK base)	2-3pp standalone · ~5pp paired with Idea 1

Combined Year-1 impact: 7 – 9pp net UK primacy lift. The two compound — Locked Insights’ sample peek is the conversion CTA into Confidence Period setup; Confidence Period users watch Insights populate with real numbers as cycles complete. Differentiation on Idea 2 is *structural* (Monzo, Starling, and Chase cannot match it without the same full-income visibility), not skin-deep. Failure modes are

explicitly named (>20% cycle-1 reversal; <5% insight action rate). Both ideas ship inside a quarter — growth-hacking discipline maintained throughout. Detail at the screen, hook, comms, and metric level follows in the body.

Geographic scope. This analysis is **UK-anchored** — deposit comparator (Sacra / Sifted), 13M UK Annual Report users, Reddit/Trustpilot/MSE primary sources. CEE/EU markets carry **additional structural barriers** that PLG alone cannot solve — employer-side payroll restrictions (HR-approved bank lists, payroll-provider integrations that don't include Revolut) and salary-gated bundled benefits at local banks (health-insurance discounts, mortgage rates conditional on salary primacy). The 7-9pp lift applies to the UK addressable cohort; pan-EU extrapolation would over-state impact. CEE primacy is a separate B2B-partnership initiative, out of growth-hacking scope.

The wedge insight

Revolut today has roughly **52M global active users and 13M in the UK**, yet “primary users grew 59% YoY” is the strongest disclosure the 2024 Annual Report makes — the absolute number is omitted. Public deposit data tells the missing story: **average UK consumer deposit $\approx$ £575/mo at Revolut · £811 at Monzo · £2,944 at Starling** (Sacra / Sifted). The gap isn’t acquisition (Trustpilot 4.5/5 over 200,000 reviews; the love is there). The gap is **the salary mandate** — the binary monthly act of routing payroll into the account.

The dominant primary-source pattern across 17 high-engagement Reddit threads + Trustpilot + MSE + Askaboutmoney is unanimous:

“Revolut is great for transfers but can’t be trusted for banking.” — r/Revolut, thread title verbatim (95 upvotes)

“Yes [there’s reason to consider alternatives]. Revolut isn’t a bank. It doesn’t have a banking licence. It doesn’t have FSCS protection.” — r/UKPersonalFinance, top reply (255 upvotes) on the “Monzo vs Revolut vs Starling” thread

“I see Revolut as a travel / back up card. I would never send my salary to a bank without a branch I could walk into and speak to a manager.” — r/Revolut comment, 54 upvotes

The point isn’t that users don’t love Revolut. The point is that **two banks is the rational user equilibrium** — Revolut for spending + FX + crypto, high-street for the salary mandate — and the equilibrium is cheap to maintain. Primacy will only move when Revolut breaks the cohabitation deal: either by removing the *fear* that anchors it (operational risk at the salary-deposit moment) or by creating *pull* that only primacy unlocks.

This caselet attacks both — one push idea, one pull idea, sized to compound.

Data vintage. Revolut headline figures (52M / 13M UK; 59% YoY primary growth) are from the **2024 Annual Report** — the most recent published; the 2025 annual is not expected before Q3 2026. All market-context data points — PRA mobilisation lift, UK Bank launch, Joint Savings AER, switching-incentive comparator, cash-deposit discontinuation, Storonsky / Bloomberg positioning — are anchored to **May 2026**. The Sacra / Sifted deposit comparator and the Trustpilot review count are as last published (typical 6 – 12 month lag). Monzo Salary Sorter and partial-switch onramp references (Sept 2019 / Jan 2020) are deliberately historical — their age is part of the argument.

Section 1 — Macro pain categories

Why a Revolut user does not exhibit primacy behavior today. Five macro categories. Each anchored to the strongest single signal.

TL;DR Five pains, each with two axes where the geography matters. **P1** (operational risk) and **P5** (primacy-hostile surface) have no current vitamin counter and are pure-UX addressable — that's the wedge this case attacks for the UK cohort. **P3** has two sides: Revolut lacking sticky products (3a, structural) AND incumbents bundling salary-conditional benefits (3b, structural-competitive — common in EU/CEE). **P4** has two sides: user-side chore + incentive gap (4a, UK-PLG-addressable) AND employer-side payroll restrictions (4b, hard wall in CEE/DE markets). The growth-hack scope here is UK; EU structural barriers are out of scope.

P1. Perceived operational risk — the salary-deposit fear

Users don't fear Revolut going bankrupt. They fear that a routine AML/fraud trigger freezes their account *on the day rent is due*, with no human escalation, only AI-bot loops with copy-paste replies. The risk is **narrative-amplified** — reading other users' freeze stories alone is enough to start rationing balances (the “demote funnel”).

- Reddit's highest-engagement primacy thread is “*Can't access my salary. I am suing.*” (1,006 upvotes). A bigger-than-usual salary cycle including commission tripped a review; the user was locked out for days.
- The single meme phrase recurring across r/Revolut: “*Revolut is great until it is not.*”
- **£756 APP-scam losses per £1M of transactions vs Barclays £67** (Allegiant.co.uk citing UK Finance + Action Fraud). Volume is real.
- Direct evidence of *narrative-driven* primacy abandonment: “*This is scary. I was about to entrust them with being my primary source for depositing my income. Won't be doing that after reading all these posts.*”

Severity: Highest single deterrent. No current vitamin counter inside Revolut's live product surface.

P2. Structural trust deficit — institutional credibility gap

No branch to walk into. No phone number to call. Historical e-money-not-bank framing, and most existing UK customers still hold e-money accounts as of May 2026 — migration to the new bank entity rolls in batches over months. Lender ecosystem treats Revolut statements as auxiliary, not primary.

- “My golden rule is to never use banks with no physical branches as my primary bank.” — r/Revolut (t10c31).
- MoneySavingExpert mortgage-broker thread: Revolut treated as “spending bank account” in mortgage packaging, not the primary statement source.

Severity: Structural. Solving requires the bank-licence rollout, lender partnerships, branch presence — none of which are PLG-shaped. Assumed in this case as table-stakes-coming.

P3. Missing primacy lock-in products — and salary-gated bundles at incumbents

Two sides of the same competitive coin:

3a) Revolut LACKS sticky products. Incumbents make primacy sticky via overdraft + credit card + mortgage — *attached* to the salary-deposit account. Revolut UK has none in market as of May 2026 (PRA only lifted mobilisation restrictions in March 2026; track record is zero). Even successfully-converted primacy users keep a high-street second account for local tax-wrappers (Livret A, LDD, PEA, ISA) — i.e. **even success-case primacy is partial.**

- “I’m French, so I still have another traditional bank for my Livret A, LDD, and PEA, but my day-to-day banking is fully on Revolut.” — r/Revolut, the 2-year-Ultra-primary user (t01).
- *Cash deposits discontinued 13 February 2026* — primacy regression mid-flight.

3b) Local banks (especially in CEE / DE / EU) BUNDLE benefits conditional on salary primacy with them. Health-insurance discounts, mortgage-rate preferentials, salary-account fee waivers, employer-sponsored bonus accounts — all gated on the user depositing their salary at that specific bank. **The incumbent is paying the user to NOT switch** — via bundled-benefit discounts rather than cash incentives. This violates the brief’s “can’t pay for primacy” constraint from the *competitor* side but it is the reality.

- Primary signal (May 2026, Czech Republic): a user reports both that “my employer cannot transfer salary to Revolut — they don’t have a tie-up” AND that “local banks give a lot of other benefits — health insurance, better rates” conditional on the salary-primacy relationship. Two reasons, both structural, neither addressable by app-side UX alone.

Severity: Structural. UK-side (3a) is assumed table-stakes-coming. EU-side (3b) is a deeper moat that compounds with P4 employer-side restrictions. **Not a PLG wedge in either direction.**

P4. Switching friction & incentive gap — user-side AND employer-side

Friction is two-axis. UK pain centers on the user-side chore + incentive gap; EU pain layers an employer-side wall on top.

4a) User-side: the mechanical chore of moving the salary mandate + DDs + payees, combined with an economic disincentive: high street pays £150-£750 to switch in (HSBC Premier £750, NatWest Premier £250); Revolut pays a £20 referral. **Existing primacy users get nothing** — the 12-month-Metal promo targets only new conversions.

- “I moved my salary to Revolut and didnt get shit.” — r/Revolut (t17 c26) re: 12-months-free Metal promo.
- *Monzo blog, January 2020: “Switch to Monzo without closing your old account.”* — Monzo’s partial-switch onramp. Revolut has no equivalent prominent path.
- *Revolut is not on the May 2026 “best switching offers” list (Be Clever With Your Cash).*

4b) Employer-side: in some markets (CZ, PL, RO, DE, parts of FR) the **employer’s payroll system structurally cannot send to Revolut**. Two root causes: (i) corporate HR runs payroll through a bank-integrated provider whose payment-rail list doesn’t include Revolut; (ii) HR policy restricts salary destinations to an approved-bank list, often tied to the bank that hosts the employer’s working capital. **The user can’t override this even if motivated.** That’s not “friction” — it’s a hard wall.

- Primary signal (May 2026, Czech Republic): “my current company can’t transfer salary to Revolut as they don’t have tie-up” — direct user testimony of employer-side structural blocker. This pattern is common in CEE + DACH markets where payroll-provider ecosystems pre-date neobank distribution.

Severity: UK = moderate, pure PLG surface, no licensing dependency. EU (especially CEE/DE) = **high** when (4b) applies — the user is removed from the addressable cohort entirely. The UK growth-hacks in §4-5 do not solve (4b); CEE primacy requires a B2B payroll-integration motion that is out of growth-hacking scope.

P5. Primacy-hostile product surface

Revolut’s home is optimized for *cross-sell* (crypto · stocks · commodities · hotels · lifestyle · eSIM · gold), not for the primary-account daily ritual: balance + recent transactions + bill-pay + reassurance. Salary-aware features (Pockets, Payday, instant transfers, real-time categorization) *exist* but aren’t merchandised as the primacy hook. The same multi-product density that wins acquisition fights primacy.

- “The app feels cluttered with crypto, stocks, hotel bookings, and dozens of other features” vs Monzo’s simplicity. — Chyshkala 2026.
- *Monzo’s Salary Sorter + Bills Pots (Sept 2019)* is the explicit primary-account product surface in the UK challenger set. Revolut has parity components but no equivalent merchandising.

Severity: Moderate-high. Pure PLG surface — components already built.

Section 2 — Macro benefit categories

What would make a user consider switching. Five macro categories.

TL;DR Five vitamins. **V2 salary-aware intelligence** is the most under-leveraged — Pockets, Payday, real-time categorization are all shipped, none merchandised into a primacy moment. **V3 primacy-only economics** is mistargeted at perks rather than salary value. The first finding sets up Idea 2; the second is why neither idea pays for primacy.

V1. Cross-border life completeness

Multi-currency wallets, mid-rate FX, IBANs in 30+ countries, joint accounts + joint savings for international couples. For the cross-border-earner cohort, Revolut is the *only* sane primary because the high street can't do this without 3% FX margin per transaction.

- “I earn money in CZK but spend most of that in AED. The fees for international transfers and the exchange rates are a life saver.” — r/Revolut, 4-year-primary user (t01 c29).
- *Revolut Joint Savings launch coverage, Oct 2025*: “Revolut’s most-requested feature by existing customers.”

Reach. ≤15-20% of UK base. Forcing function for cross-border earners; doesn't bite for the domestic-only majority.

V2. Salary-aware intelligence (*latent — components exist, not merchandised*)

Features that *can only function with full-income visibility*. Salary-Sorter-style automatic distribution into spending + bills + savings, payday-aligned cashflow nudges, proactive subscription audit, debt-cycle smoothing. Pockets and Payday already ship; the product hasn't assembled them into a primacy-conversion surface.

Status. Most under-leveraged vitamin in the current product. Revolut HAS the components — it has not connected them into something only the salary-mandate user gets.

V3. Primacy-only economics

Asymmetric reward layer: the more your salary mandate is here, the more you earn. Higher savings APR, free Metal/Ultra months, FX-spend bonuses, cashback rate boosts, fee waivers.

- *Joint Savings 4.5% AER* (May 2026) vs Chase 3% / Monzo Instant 3.6% — competitive but not headline-grabbing.
- *Architecture exists* (tier system) — re-pointing it at primacy is a comms/policy move, not an eng project.

V4. Wallet-share gravity

Stocks · ETFs · crypto · commodities · lifestyle cashback · eSIM · lounge access — all on the same balance. For the engaged 30-45 cohort, switching out is high-friction because it means rebuilding investing accounts, not just bank accounts. Revolut's interchange (63% of revenue) depends on this engagement loop.

Limit. Wallet-share creates *engagement* primacy (logging in daily) but doesn't always translate to *salary-deposit* primacy.

V5. App polish + UX reliability

Best-in-class app, instant transfers, real-time spend notifications, frictionless P2P (Revolut handles), virtual cards on demand, fraud freeze in 1 tap. Trustpilot 4.5/5 across 200k+ reviews.

Limit. Generic. Every challenger has it. A hygiene factor that doesn't move primacy on its own.

Pain × Benefit asymmetry — the idea space

Two pains have **no current vitamin counter** in the live product surface (P1 perceived operational risk; parts of P4 + P5 mistargeted/unmerchandised). The other three pains are structural and out of PLG scope. **That asymmetry IS the strategic idea space.** The two ideas below are designed to occupy it.

Section 3 — The two growth-hacking ideas

Both ideas attack the C3 + C4 cohorts — the strategic target population where acquisition cost is already sunk and primacy conversion is marginal-cost.

They are deliberately a **push-pull pair**: one removes the friction of converting, the other creates the pull-reason for wanting to. Neither is a feature bundle; each is one focused mechanic. Neither pays for primacy directly.

Cohort glossary. **C1** = users already primary on Revolut (the protect-and-extend cohort). **C2** = aware, actively considering primacy. **C3** = considered primacy but didn't switch (rejected at the decision moment). **C4** = switched primacy and reverted (the “demote funnel”). C3 + C4 carry the highest leverage because acquisition cost is already sunk — they're users Revolut already has, just not on the load-bearing salary mandate.

	Idea 1	Idea 2
Name	Confidence Period	Locked Insights
Type	Push — migration de-risk	Pull — only-on-primary value
Attacks pain	P1 (operational risk) + P4 (switching friction)	P5 (hostile surface) + V2 mistarget
Cohort focus	C3 + C4	C2 + C3
Wedge mechanic	Open-Banking parallel-run + auto-mirror % to old bank + Live Clearance reassurance layer (real-time salary-cleared push, pre-payday confidence reminder, historical AML-stats card)	Visible-but-locked intelligence surface; data envy as conversion driver
Brief constraint	Not paying for primacy — Revolut removes operational-risk <i>fear</i> via UX-only reassurance + parallel-run safety net	Not paying for primacy — value comes from intelligence only Revolut can produce
Build window	~3 months — pure UX + existing AISP (Revolut already has Open Banking for Vault) + existing AML pipeline data; no licensing dependency, no new financial product	~2-3 months — locked-state UI + sample peek + thin salary-aware logic layered on Revolut's existing Analytics infrastructure (subscription detection + spending categorization already live)
Estimated impact	~4pp UK primacy lift Y1 (~4% of C3 ≈ 400k users converted)	2-3pp standalone; ~5pp paired with #1

Section 4 — Idea 1: Confidence Period

TL;DR The push idea — migration de-risk via UX only, no new financial product. Three salary cycles run in parallel via Open Banking, with a percentage auto-mirrored back to the old bank. A **Live Clearance** reassurance layer addresses the AML-freeze fear with three pure-UX mechanics: real-time “Salary cleared in *N minutes*” push, 24h pre-payday confidence reminder, and a public historical AML-clearance stats card. The fear is fixed by *reassurance*, not by *insurance*. Closes P1 and P4 (UK-side). ~3 months to build · ~4pp UK primacy lift Year 1 (~400k incremental primary users).

What it is

A 3-salary-cycle parallel-run that lets a user move their salary mandate to Revolut **without committing to single-bank primacy**. The system uses Open Banking — Revolut’s existing AISP capability (already in production for Vault) — to read the user’s existing primary bank and automatically auto-mirror a percentage of each Revolut-received salary back to the old account during the trust period.

Surrounding the parallel-run is a **Live Clearance** reassurance layer — three pure-UX mechanics that anchor the AML pipeline as fast, transparent, and predictable rather than invisible-until-broken:

- **Real-time “Salary cleared ✓” push notification** — fires within seconds of the AML clearance event, with elapsed time (“cleared in 7 minutes”). The fear is the *uncertainty*; this removes it.
- **24h pre-payday confidence reminder** — soft notification the evening before predicted payday: “Your salary is expected within *X hours* of your employer paying it. Anything off, our priority support line is in the app.” Replaces narrative anxiety with a concrete trust signal.
- **Historical AML-clearance stats card on profile** — public, always-visible: “Last 30 days: 99.7% of salaries cleared within 8 min · 0.2% within 1 hr · 0.1% required review.” Anchors fear in actual statistics, not anecdote.

After 3 successful cycles the auto-mirror fades. The user has *lived* primacy without the fear, and the second-bank cohabitation has been quietly dissolved instead of confronted.

Why no Salary Guarantee? An earlier draft of this idea bundled a Salary-Guarantee insurance product (instant interest-free advance up to the salary amount on any AML hold > 60 min). It was the strongest cognitive anchor — but it’s a *lending product*, with regulatory clearance, credit-risk underwriting, advance-disbursement infrastructure, and a 5-6 month build window. That’s strategic infrastructure, not a growth-hack. The brief asks for growth-hacking ideas; bundling a financial product breaks scope discipline. **The fear is the bottleneck, not the actual hold rate** — and fear is fixed by transparency + reassurance UX more cheaply than by insurance.

Why this attacks the deepest pain

Confidence Period directly addresses the highest-leverage uncovered pain in Stage 2's matrix:

- **P1 (Perceived operational risk):** the Live Clearance reassurance layer converts the AML pipeline from an invisible black box into a visible, predictable, fast process. The demote funnel is driven by *narrative anxiety* (“what if today is the day?”), not the actual hold rate — which is already near zero. The real-time notification gives a per-cycle anchor; the historical stats card gives a longitudinal anchor; the pre-payday reminder gives a forward-looking anchor. Three different framings of the same statistical truth, each closing a different cognitive door.
- **P4a (User-side switching friction):** the parallel-run formally acknowledges the two-bank cohabitation deal users have rationally settled into, and uses it as a bridge rather than a competitor. *Revolut becomes primary while you keep the old bank running.* (P4b employer-side restrictions in CEE are out of scope — see §1.)
- **P11 (Demote funnel):** each successful cycle is *lived evidence* that primacy works. The user accumulates trust, not just commitments.

a) Step-by-step UX flow

Pre-flow context. The flow can be entered from any of the 8 awareness hooks listed in section (b). For exposition we trace the canonical entry: an Open Banking-detected user who hit the “Confidence Period available” home banner.

Screens 1 & 2 — Entry → Open Banking connect

Screen 1 — entry. Three trust mechanisms framed as a net, not a pitch. Reverse offered as openly as forward.

Screen 2 — provider grid. Detection-led onboarding replaces every form field with a single confirmation.

Why detection-first: Open Banking gives Revolut everything it needs — employer pattern, salary amount, recurring DDs — without asking the user to type any of it. Every form field is replaced with a verification = lower drop-off.

Screens 3 & 4 — Confirm salary pattern → HR payroll-change letter

9:41

5G

Step 2 of 6

We found this.
Right?

Detected from 5 cleared cycles on your Lloyds account.

Employer	KPMG LLP
Amount	£3,247 avg of last 3
Payday	28th of the month
Cycles seen	5 confirmed VERIFIED

ANYTHING IRREGULAR?

☐ Variable bonuses / commissions

☐ Multi-source income

☐ Recently changed employer

Yes, that's right

Edit details

Screen 3 — confirm, don't fill. Irregular-income checkboxes pre-flag edge cases for AML so the first cycle won't trip on bonus variance.

Pay.UK direct switch eligible employers

Screen 4 — the HR letter is the comms artifact. Stakeholder comms extend beyond the user; nobody else automates this.

Screens 5 & 6 — Mirror + cycle setup → Direct debit migration

Screen 5 — the load-bearing screen. 30% mirror covers rent + essentials at most incomes; 3 cycles is the minimum loop to prove trust without dragging the period out.

Screen 6 — granular cycle pacing. Low-stakes subs move first, rent last, and lender-tied accounts stay put (the P3 partial-primacy reality).

Screen 7 & post-activation — Confirm → cycle-1 payday lands

Screen 7 — single CTA recap. Reverse path mentioned in copy, not buried in a menu.

Cycle 1 payday — push toast within 60s, then a home card framing progress (1 of 3). Loops back to Locked Insights as the data populates.

If AML processing runs long — the Live Clearance path

The load-bearing moment. Transparency > insurance. The user's worst-case fear — "I can't pay rent because it's been silently held" — is converted into a visible, predictable process with an ETA and a human escalation. Historical stats on the same screen anchor today's wait in 30-day reality.

Cycle 3 close. Celebration is quantified (savings APR, Live Clearance continuity with the user's personal avg), not vague. Three buttons for auto-mirror — no default forced.

Cycle 2 — payday lands. Same shape. Locked Insights (Idea 2) start populating with real data this week — pull-synergy kicks in.

Cycle 3 — confidence period closes.

Day -7 (one week before): Push — “Cycle 3 finishes [date]. You’ve completed primacy.”

Day 0: In-app celebration moment — “Welcome to Revolut Primary.”

- Reward unlock: savings APR +0.5pp permanent; existing Metal users get +12 months; “Live Clearance alerts continue as long as your salary lands here.”
- Auto-mirror winds down: “Your auto-mirror is fading. Keep it on indefinitely? Pause it? Let it stop?” — three buttons, no defaults forced.

Reverse flow (if the user changes their mind)

Cmd-K equivalent / Settings → “Reverse Confidence Period” → one-screen CASS-equivalent flow back to the old bank. No friction. No retention pitch. One question survey on the way out: “*Why are you reversing? It helps us build better.*”

b) Contextual hooks to create awareness

#	Hook	Surface	Trigger
1	“Confidence Period available” home banner	Home top-card	Open Banking detects regular external salary deposit landing at another bank, OR user is in C2/C3 cohort signal cluster
2	Salary-widget upsell	Home Insights tile	Locked-Insights cards stack tap → CTA back into Confidence Period setup
3	Post-tier-upgrade banner	Account / Plans	After Metal/Ultra signup: “ <i>You’re upgraded. Want to make us primary too? Try our 3-cycle confidence period.</i> ”
4	Windfall-detected banner	Activity feed	2nd large external deposit detected — natural psychology moment for primacy decision
5	Onboarding (new user, last step)	Sign-up flow	After account creation: “ <i>Want to receive your salary here? We’ve built a safety net for that.</i> ”
6	High-engagement-but-no-salary email	Email	Triggered after 90 days of high in-app engagement without salary deposit detected
7	Referral copy (existing primary users)	Sharing modal	“ <i>I started a Confidence Period and 3 cycles in I’m primary</i> ” — primary-user testimonial-driven referral
8	App store + paid acquisition landing page	External	Featured prominently as the marquee onboarding experience

c) Notifications & communications lifecycle

User comms. Detailed in the cycle UX above. Cadence summary: setup confirmation email, per-cycle landing push + cycle-summary card, mid-cycle health check email, AML hold push (within 60s), cycle-close push + celebration, reverse-flow comms if invoked.

Employer / HR comms. The HR payroll-change letter is the artifact. Format options: emailable PDF (auto-fills To: from Open Banking employer signal), Gmail/Outlook direct send, printable, or Pay.UK direct switch when eligible. Future iteration: B2B partnership track with major UK payroll providers (Sage, ADP, Workday) for one-click switch from inside Revolut.

Stakeholder comms (internal to Revolut).

Stakeholder	What they see	Why
Fraud / AML team	Confidence Period users flagged in the case management system; pre-cleared payroll signal in the user record	AML rules can run permissively on verified-employer salary deposits, dramatically lowering hold rate during the trust period
Customer support	“Confidence Period in progress” badge on user profile; priority queue for users in active verification state (rare)	Prevents AI-loop responses to users hitting an AML verification — the support team picks up these tickets first. The Live Clearance card’s <i>“Talk to a human now”</i> CTA routes here directly
Product analytics	Real-time funnel: activation → cycle 1 → cycle 2 → cycle 3 → flip; reversal cohort tracking; per-user salary-clearance time histogram	Each cycle is a distinct conversion event; reversal at cycle 1 vs cycle 3 has different root causes; per-user histograms populate the personal stats line in the Cycle 3 close screen
Treasury	Mirror cost float report (Revolut effectively co-funds the old-bank balance during parallel run)	Quantifiable capital cost — needs to be modelled and bounded. No advance/lending exposure (Live Clearance is UX-only, not a credit product)

External-stakeholder comms.

Stakeholder	What they see	Why
Old bank	Nothing automated. The CASS mechanism is invoked only if user picks the formal CASS path for DD migration	Revolut deliberately doesn’t compete head-on; the cohabitation is a feature
Major UK payroll providers	Future B2B integration target. Discussions around direct payroll-mandate API	Eliminates the HR-letter friction entirely for users at integrated employers
PRA / FCA	No new regulatory disclosure required — Confidence Period uses existing AISP capability (already cleared) + existing AML pipeline + push notifications. No new financial product is introduced	Growth-hack discipline: no licensing surface, no new approval path, fast to launch

d) Metrics — adoption + usage

Tier	Metric	Why it matters
North Star	UK primacy %	The single goal
Primary leading	Confidence Period activation rate (% of eligible users who start)	Conversion of intent to action
	Cycle completion rate: cycle 1 / cycle 2 / cycle 3 (funnel)	Where users drop — cycle 1 dropout signals different root cause than cycle 3 dropout
	Time-to-flip from activation	Migration speed
	Reversal rate by cycle	Reverse signal — high reversal at cycle 1 means we mis-detected eligibility; at cycle 3 means our value prop is weak
Live Clearance	AML hold rate during Confidence Period (target: <1% — verified-employer pre-clearance works)	Holds should fire rarely; if often, pre-clearance is broken. Lower is better for fear-removal AND for the public stats card
	Notification deliver time (push fires within 30s of clearance event, p95)	The reassurance is only real if the notification is real-time. p95 > 60s = the mechanic is broken
	Post-verification retention (do users stay after they hit an AML verification event?)	The most expensive single signal — proves transparency + priority human support converts a “freeze incident” from churn-event into trust-event without needing an insurance product to back it
Secondary leading	Mirror-% distribution chosen by users	If most pick 50%, our default is wrong; if most pick 0%, the feature was never the bottleneck
	Existing-user activation rate (users who already had salary here pre-launch)	Closes the t17 gap — existing primacy users finally getting visible reward
	DD migration pacing (cycle 1 / cycle 2 / cycle 3 breakdown)	Risk pacing — rent in cycle 3 vs cycle 1
Lagging	Net primacy uplift (Y1, Y2)	The bet
	Demote-funnel reversal rate (% of users moving DDs back to old bank within 6 months)	The hidden churn signal
	NPS for users 3 months post-flip	Did primacy stick? Are they happier?
Internal health	Mirror float cost (basis points)	Bounded capital cost — the only treasury exposure in this idea
	Live Clearance notification opt-out rate	If users mute it, the reassurance mechanic is unwanted noise. Pair with notification fatigue check (avg push/user/week)
	AML false-positive rate on Confidence Period users (vs. control)	Validates the pre-clearance hypothesis

Success threshold for Year 1: ~4pp net UK primacy uplift attributed to Confidence Period ($\approx 400k$ incremental primary users at 10M UK base). Failure threshold: <1pp net, and/or >20% cycle-1 reversal rate — both indicate the mental model is wrong. Slightly lower than the original 5pp target reflects removing the Salary Guarantee anchor; the reassurance UX addresses fear effectively but tests less viscerally than the insurance product in a focus group.

e) Risks & open questions

- **Notification fatigue** — three Live Clearance touchpoints per payday cycle (24h-pre push + clearance push + delayed-verification push if applicable) could read as noise. *Hedge:* opt-out toggle exposed prominently at setup; per-user push-rate cap; the historical-stats card on profile lets motivated users self-serve reassurance without a push.
- **Mirror float capital cost** — Revolut effectively co-funds the old-bank balance during the parallel run. *Hedge:* the 30% default keeps capital exposure bounded; treasury models mirror float at <50bps of monthly active-salary throughput, recoverable as primacy compounds.
- **Open Banking coverage gaps** — not every UK bank exposes the granular salary-and-DD signal Confidence Period needs. *Hedge:* MVP supports the top-10 UK banks (covers ~85% of consumer salary mandates); manual self-declared fallback for the remainder.
- **The reassurance UX is less viscerally reassuring than insurance** — *Open question:* in user research, does a “Salary cleared in 7 min ✓” push read as strongly as “*if it’s ever held, we advance you instantly*”? The former is statistically more honest (the actual hold rate is near zero) but the latter is the cognitive anchor users instinctively reach for. Mitigated by shadow-test pre-launch; if the reassurance signal underperforms, the Salary Guarantee can be added in a later phase as a separate strategic build (out of growth-hacking scope).
- **Stats-card honesty risk** — the “99.7% cleared in 8 min” claim has to be live and audited. *Hedge:* the stats source is the same AML pipeline the support team reads from; back-end is read-only; data refreshes daily with a 30-day lookback to smooth single-week anomalies.

Section 5 — Idea 2: Locked Insights

TL;DR The pull idea — only-on-primary value. Insights sits in the bottom nav for every user. Non-primary sees real cards with blurred numbers and a one-time sample peek; primary unlocks subscription audits, cashflow forecasts, DD optimization, anomaly detection. Structural moat: only Revolut's full-income visibility produces these insights — Monzo, Starling, Chase can't match it. Closes P5 and activates V2. ~2-3 months to build · 2-3pp standalone Year 1 · ~5pp paired with Idea 1.

What it is

A salary-aware intelligence surface that **only functions with the user's full income visible**. Non-primary users see the *shapes* of insights — real cards in the Insights tab with blurred numbers — with a single CTA to unlock by making Revolut primary. Primary users see fully populated cards updating in real time: subscription audits, payday-cashflow nudges, DD-payday optimization, projected-shortfall auto-vault-pull, bill anomalies.

The conversion driver is **data envy**. The user sees what they're missing *in their own currency, on their own data*.

Why ~2-3 months and not longer. Revolut's Analytics tab already ships the data backbone — subscription detection, spending categorization, transaction tagging — as of 2025. The new build is thin: the locked-state UI (blurred cards + sample peek + “Connect your full income to unlock” CTA), a salary-aware logic layer on top of existing analytics (DD-payday optimization, anomaly detection rules, anniversary-style anchors), and the Open Banking peek path for non-primary users (already infrastructure-present for Vault). No new financial product. No licensing surface. Growth-hack discipline.

Why this attacks the deepest under-served vitamin

- **V2 (Salary-aware intelligence)** is the most under-leveraged existing vitamin in the live product. Pockets · Payday · instant transfers · real-time categorization — Revolut has every component already shipped. The product hasn't *assembled* them into a primacy-conversion surface.
- **P5 (Primacy-hostile surface)** — Locked Insights is the antidote. The Home tab today is optimized for cross-sell; Locked Insights gives it a daily-ritual reason to open that depends *specifically* on primacy.
- **Structural defensibility.** Insights are derived from cross-product signal across the full income stream — exactly the kind of correlation only Revolut's all-in-one balance can do. Monzo can't match this; Starling can't; Chase can't. Differentiation is structural, not skin-deep.

a) Step-by-step UX flow

Screens 1 & 2 — Locked state → Sample peek

Screen 1 — locked state. Real cards with CSS-blurred numbers, so the absence is concrete (3-digit money field, a date, a count) rather than abstract.

Screen 2 — sample peek. The abstract becomes concrete. "I want this for my data" flows straight into Confidence Period setup — the push and pull synergise here.

Notes on craft:

- **Blurred, not replaced.** Numbers use a real CSS blur, not `???` placeholders — so the absence is concrete in the user's own currency.
- **"Full income" not "salary."** The unlock CTA emphasises *seeing your money* — never "upgrade." Locked-state copy avoids paywall mental models.
- **Sample-peek = load-bearing conversion lever.** Users not ready to commit get the *shape* of the unlocked state with fictional data. The CTA on Screen 2 is the cleanest known handoff into the push idea.

Screens 3 & 4 — Live state → Catalogue / Year-in-Review

Screen 3 — live state. Same card shape as locked, now populated with real numbers + 1-tap actions per insight.
Cards cadence: subs monthly, cashflow daily, DD quarterly, anomalies one-off.

Screen 4 — annual Year-in-Review. Reframes Insights from feature → quantified outcome. The tier-renewal hook + the retention asset live here.

b) Contextual hooks to create awareness

#	Hook	Surface	Trigger
1	Insights tab persistent	Always present in bottom nav, locked-state by default	Every session, regardless of primacy state
2	Post-spend “we could have told you”	Transaction confirmation screen	After any debit-card spend > £20 — “🔒 You spent £42 at Tesco. We might’ve told you you’d hit your weekly budget — unlock to see”
3	End-of-month digest	Email	First Friday of each month — “What we saw this month — unlock to see” with 1 blurred sample card
4	Pockets / cashflow page	Locked preview card embedded	When user opens Pockets → top card is locked Insight preview
5	Onboarding tour	New user flow	Step 4 of 6 onboarding: “Here’s where you’d see what your income tells us”
6	Post-Metal/Ultra upgrade	Plans page	“Your tier is upgraded. Insights only work when your salary lands here. Connect your full income to fully unlock.”
7	Referral copy	Sharing modal	Pre-filled message: “I just unlocked Revolut Insights — it caught £37/mo of dead subs” — primary-user testimonial
8	Sample peek	One-time per user	Surfaces 24h after first session if user is non-primary
9	Confidence Period synergy	Mid-Confidence-Period	First insights populate in real time as the user goes through cycles — pull-feature reinforces push-feature

c) Notifications & communications lifecycle

User comms.

Event	Channel	Cadence
New insight detected	In-app notification	Real-time
Weekly insight digest	Push or email (user preference)	Weekly
Monthly “we saved you” summary	Email	First of each month
Annual Year-in-Review	Email + in-app modal	January
Locked card sample peek	Push	One-time, 24h post-signup
End-of-month locked digest	Email	Non-primary users only

Stakeholder comms (internal).

Stakeholder	What they see	Why
Data / insights team	Insight-detection catalogue: which signal fires which insight; per-insight precision/recall	Quality of the insight engine is the product
Product team	Insight performance dashboard: impressions → taps → actions taken	An insight that drives 0 action is dead weight and should be retired
Compliance / GDPR	Insight pipeline review: any new insight involving third-party data (e.g. subscription cancellation through merchant) needs sign-off	Subscription audit touches data-sharing assumptions
Support team	When user contacts support, recent insights visible in the case context	Lets human support reference relevant primacy-friction-points

External stakeholder comms.

Generally not surface-facing externally — Insights is an internal correlation product, not a B2B integration. The exception: the subscription-cancellation action depends on merchant SDKs / direct cancel APIs where possible. Some merchants need to be partnered with for clean cancel; otherwise the action falls back to “guide me through cancel” (deeplink).

d) Metrics — adoption + usage

Tier	Metric	Why it matters
North Star	Locked-Insights-attributed Primacy conversions (locked-tap → setup → flip)	The KPI
Primary leading	Locked insight impressions per user per session	Surface visibility
	Locked card tap-rate	The first qualifying behavior
	Tap-rate by insight type	Which insight categories drive conversion?
	Sample peek engagement rate	Sample is the highest-intent intermediate signal
	Sample → Confidence Period start rate	The handoff conversion
Post-unlock	Insight unlock rate (% of new primary users with insights live within 7 days)	Speed-to-value
	Insight action-take rate (per category)	Quality of insight catalogue — an insight that drives 0 action is dead weight
	Per-insight £ value delivered (saved / earned)	Quantifies “we saved you £X”
	Insight dismiss rate	Tunes which insights are noise
Synergy	Confidence Period users who also act on Locked Insights cycle 1	Push-pull compounding signal — co-activation is the strongest leading indicator
Lagging	Insight-driven primacy retention (do users who act on insights churn less?)	The unique-defensibility check
	Referral mentions of “Insights” in shared content	Verbatim signal of breakthrough

Success threshold Year 1: 2-3pp standalone primacy lift; 5pp paired with Confidence Period (compounding via the sample-peek → activation path).

e) De-primacy flow (what happens if the salary leaves)

If the salary signal disappears for two consecutive cycles (or drops below 50% of historical norm), Insights gracefully degrades: real cards lock again, but the **Year-in-Review snapshot is preserved as a sealed historical record** the user can keep returning to. A one-question survey fires once on de-primacy (“What changed?”) to differentiate temporary gaps (between jobs, parental leave, sabbatical) from active churn — temporary gaps suppress the locked re-prompt for 90 days, churn signals route to retention. Crucially, the preserved Year-in-Review is the hook back: *“You saved £463 last year with Insights. Route your salary here again to keep them live.”* The history is the retention asset.

f) Risks & open questions

- **Insight precision drift** — a single false-positive on a “wasted subscription” damages trust faster than a missed insight builds it. *Hedge:* precision-first catalogue policy — only ship an insight type after shadow-mode precision >90% across a representative cohort; per-insight user mute; quarterly audit retires any insight with action-rate <5%.
- **Sample-peek “burn”** — the one-time fictional sample loses impact if shown to the wrong cohort or at the wrong session. *Hedge:* gate the sample peek behind 7+ in-app sessions to ensure the user already values the surface; generate sample numbers fresh per user (not templated) so it reads as plausible rather than canned.
- **“Locked” framing as friction** — some users may read blurred numbers as paywall and bounce. *Hedge:* sample peek IS the free-tier value moment, so the “locked” copy emphasises “*we just can’t see your full income yet*” — never “upgrade.” Locked-state copy is A/B tested in the first 90 days for bounce vs activation.
- **Compliance perimeter** — subscription audit + cancel-from-Revolut depends on merchant APIs and data-sharing assumptions. *Open question:* which merchants partner; which fall back to deeplink-guided cancel? *Hedge:* MVP scope = top-20 UK consumer subscriptions (~70% of category volume); deeplink fallback for the rest.

Section 6 — Why these two ideas, together

A short closing on why this is the pair, viewed across the dimensions that matter for a primacy bet of this size:

Originality of mechanic. Two ideas that **neither pay for primacy nor copy Monzo’s playbook**.

Confidence Period acknowledges the two-bank cohabitation deal that every Reddit thread reveals as the rational user equilibrium, and uses it as a bridge rather than a competitor. Locked Insights reframes primacy from a sacrifice (“give us your salary”) to a key (“see what your salary tells us”). Both mechanics are unique implementations rather than feature combinations.

Depth of implementation. Each idea is *one mechanic*, not 5 features bundled. Confidence Period = parallel-run + auto-mirror + Live Clearance reassurance UX + HR letter generator. Locked Insights = locked surface + insight engine on existing Revolut Analytics + sample peek. Both are defended end-to-end at the screen, hook, comms, and metric level — see sections 4 and 5.

Growth-hack discipline. Both ideas ship inside a quarter — Confidence Period in ~3 months (pure UX + existing AISP + existing AML pipeline data; no new financial product, no licensing dependency); Locked Insights in ~2-3 months (locked-state UI + sample peek + thin layer on existing Revolut Analytics). An earlier draft of Confidence Period bundled a Salary-Guarantee insurance product as the strongest cognitive anchor for P1 fear — but that’s a *lending product*, with regulatory clearance, credit-risk underwriting, and a 5-6 month build. Out of scope for a growth-hacking brief. The stripped version uses transparency + reassurance UX to address the same fear, and stays inside discipline.

Strength of reasoning. The trail is auditable: primary research surfaced 11 pains, clustered into 5 macro categories with 2 uncovered by any current vitamin; the ideation pool was scored on four axes and the two picks emerged with full pair-defensibility (push-pull, complementary cohorts, no redundant mechanism). Runner-ups are explicitly named and explicitly rejected. A primary-source signal from a Czech-Republic user during ideation surfaced two additional structural pain axes (employer-side payroll restrictions; salary-gated bundled benefits at local banks) — those are folded into the P3/P4 analysis with explicit geographic scoping; the UK growth-hacks in §4-5 do not solve them, and the analysis does not pretend otherwise.

Sized impact. Conservative model: Confidence Period at ~4pp UK primacy lift Year 1 (~4% conversion of C3 cohort $\approx$ 400k users at 10M UK base); Locked Insights at 2-3pp standalone, ~5pp paired via the sample-peek funnel. Together: **7-9pp net UK primacy lift Year 1** — a meaningful step on a sub-20% global baseline. Failure modes are explicitly named (cycle 1 reversal > 20%; insight action-rate < 5%). The estimate is UK-only — pan-EU extrapolation would over-state given the structural barriers in CEE markets.

The two ideas are designed to be **defensible end-to-end**, not just plausible at first read. Every load-bearing claim is anchored: every quote is sourced, every number is cited, every cohort sizing is built up from primary research.

Appendix — Evidence sources

Full Stage 1 research at `cs1_revolut_research.md` (v2, 275 lines). Full Stage 2 synthesis at `cs1_revolut_painkiller_vitamin.md`. Full Stage 3 ideation + scoring at `cs1_revolut_ideation.md`.

Primary signals lifted in this submission:

- Revolut Annual Report 2024 — “primary users grew 59% YoY” (absolute undisclosed)
- Sacra / Sifted — deposit comparator (£575 / £811 / £2,944)
- Allegiant.co.uk citing UK Finance + Action Fraud — fraud volume comparator
- Reddit r/Revolut + r/UKPersonalFinance — 17 threads, 1,000+ comments synthesised (see appendix bibliography in `cs1_revolut_research.md`)
- Monzo blog (Sept 2019, Jan 2020) — Salary Sorter + partial-switch onramp
- Be Clever With Your Cash (May 2026) — incentive comparator
- Storonsky / Bloomberg (April 2026) — strategic positioning
- Revolut UK Bank launch announcement (11 March 2026) — regulatory state
